Note: All units should be able to approximate these specs. Some will exceed these specs, and others may drop slightly below them. Limit specs represent the absolute worst condition that might still be considered acceptable. A unit never fail to meet limit specs.

THEORY OF OPERATION

This PLL - controlled VHF marine transceiver provides an accurate and stable multi-channel operation.

The transceiver consists of 7 main sections:

- **Transmitter**
- **Receiver**
- **Low voltage detection**
- **Vibration Alert**
- **Voice recorder**
- **Local oscillator PLL (Phase Lock Loop) Circuit**
- **Memory backup**

● **Transmitter**

The audio is picked up from the internal MIC, the audio signal is then amplified by Audio Amplifier, U4 LM324 (2/4), U4 (3/4) and filtered by a low pass filter U4 (4/4). The audio is adjusted with VR2 to obtain a suitable Audio frequency response, and then modulated with the carrier by VCO, through Varicap (D11).

The modulated signal output from the VCO is pre-amplified by Q5, Q4 and Q3. Then it is amplified by Q12, Q6 .The amplified signal then passes through a low -pass filter network which consists of C72, L8, C66, C15, L6, C4 filters out spurious emission, and the antenna switching circuit, D1, D2. The signal is filtered by another low-pass filter circuit which consists of C16, L2, C62, C12, L1, C5, and C1. These low pass filters are necessary to suppress the second and third harmonics. The signal is then fed into the antenna input and radiated out. TX current is converted into a voltage signal, that signal fed into U2 LM2904 (2/2) for sampling. U2 is the Automatic power control (APC) circuit. When the unit is transmitting, the audio signal is added to the TX VCO Varicap D11. The capacitance of D11 is varied following the audio signal and when mixed with the carrier to form the modulated signal.

● **Receiver**

The receiver uses a double frequency super-heterodyne circuit. The first Immediate Frequency (IF) is 21.4 MHz and the second is 450 kHz.

The RF signal is received by the antenna, and passes through a low-pass filter network C1, L1, C5, C12, L2, C62, C16, C20, L7, and C67 to filter out the unwanted signals, the antenna switching circuit D1, D2 switching circuit to receive. The received RF signal is sent to a SAW filter F1 to filter out-of-band signals. The RF amplifier Q7 amplifies signals within the range of the frequency coverage and passes though another saw filter F2 to further filter out-of-band signals. The RF signal then is mixed with the local oscillation frequency by the mixer Q8. A first IF (Immediate Frequency) 21.4 MHz is produced. The IF is

passed through a pair of crystal filter F3 (1/2), F4 (2/2) to further filter other unwanted signals. The first IF then is amplified by Q2 and the IF amplifier U1 (BA4116). U1 is a integrated RF amplifier which consists of a local oscillator, a demodulator, a second mixer, squelch control circuit, and RF amplifier. The 21.4 MHz IF then is mixed here with second mixer and converted into 2nd Immediate Frequency (IF) 450 kHz. The 2nd IF passes through a ceramic filter F5 to filter out the residue unwanted signal at pin 5 of U1 (BA4116) output this final IF signal and the Audio signal is output at pin 9 of U1 (BA4116). The audio signal is fed through a volume control VR3 and finally amplified by Audio amplifier U11 (NJM2070) and heard in the speaker. The squelch control is also controlled by U1 (BA4116). The second IF passes through U1 (BA4116) internal squelch control R90, C141, C142 form as a squelch amplifier. The ceramic filter produces a squelch signal (RF noise). Pin 14 of U1 sends the digital squelch control signal to the CPU mute the audio speaker path. Pin 12 of U1 output a RSSI level to the CPU.

- **Low Voltage Detection**

The battery voltage, divided by R148, R149 is input to U7 Pin 6 for voltage level sample.

- **Vibration Alert**

When vibration alert is on, Pin54 of U7 output HI level, Q23 switch on, M1 MOTORS vibrates.

- **Voice recorder**

Voice recorder consists of U10 NJM4053 and U402 ISD1730. U10 Pin14 select voice source from P13 (MIC) or P12 (RX voice). The voice signal comes to U402 Pin9. U402 store the voice in it up to 20 seconds. When U402 play, the voice come out form U402 Pin17. Then pass to U10 Pin15, after that pass to Pin1 (speaker) or Pin2 (TX).

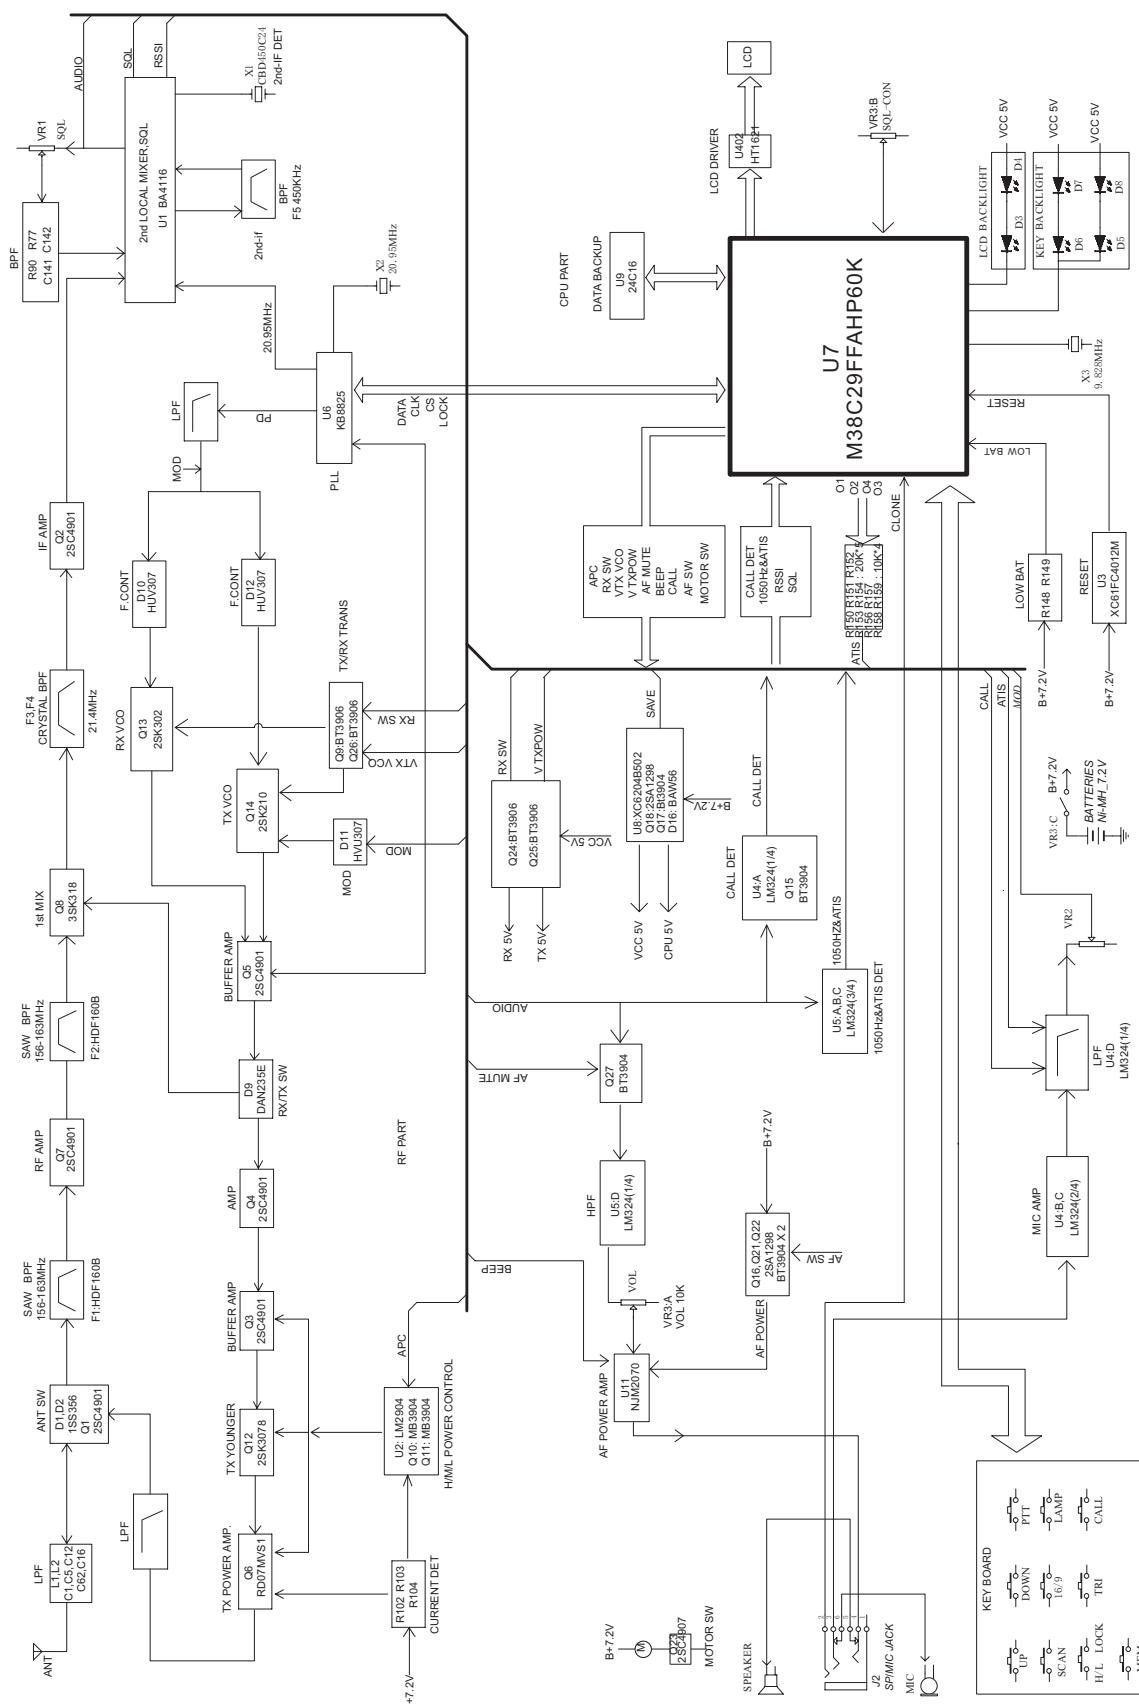

- **PLL (Phase Lock Loop) Circuit:**

The receiver and transmitter both share the same PLL (Phase Lock Loop) Circuit to produce the carrier or the receive frequency. The local oscillator consists of a fundamental frequency oscillator X1 20.95MHz and U6 (KB8825). A phase Lock Loop (PLL) U6 (KB8825), TX VCO Q14 and RX VCO Q13. The fundamental frequency is frequency divided by U6 and a 12.5 kHz signal is produced. When the VCO frequency applied to and frequency divided by U6 produces a frequency comparable to 12.5 kHz, PLL will control the VCO. When these two frequencies are matched, a constant control voltage is output from PLL to lock VCO in desired frequency. The PLL also will output a lock indication to MCU to indicate the PLL is in frequency lock state.

- **Memory Backup**

U9 is an EEPROM AT24 C16 that acts as a memory backup for the working channel code and the system parameters. Every time when the unit is switched on, the MCU will reset the system, clear the RAM, and recall in the memory from the EEPROM to refresh the RAM in CPU U7.

DISASSEMBLY INSTRUCTIONS

To remove the front and rear panels from the main chassis:

1. Remove the rubber antenna, SPK/MIC knob and the VOL/SQL knob from the main unit.
2. Remove 4 screws from the rear housing of main unit.
3. Detach the die cast from the front housing.

ALIGNMENT AND PROCEDURES

This unit has been fully aligned at the factory before shipment and does not normally require further adjustment. When necessary, however, the unit may be aligned as indicated below.

Do not adjust any circuit in this radiotelephone unless you understand the circuit operation and have experience in adjusting the radiotelephone. Tampering with the radiotelephone may upset the alignment and lower its performance.

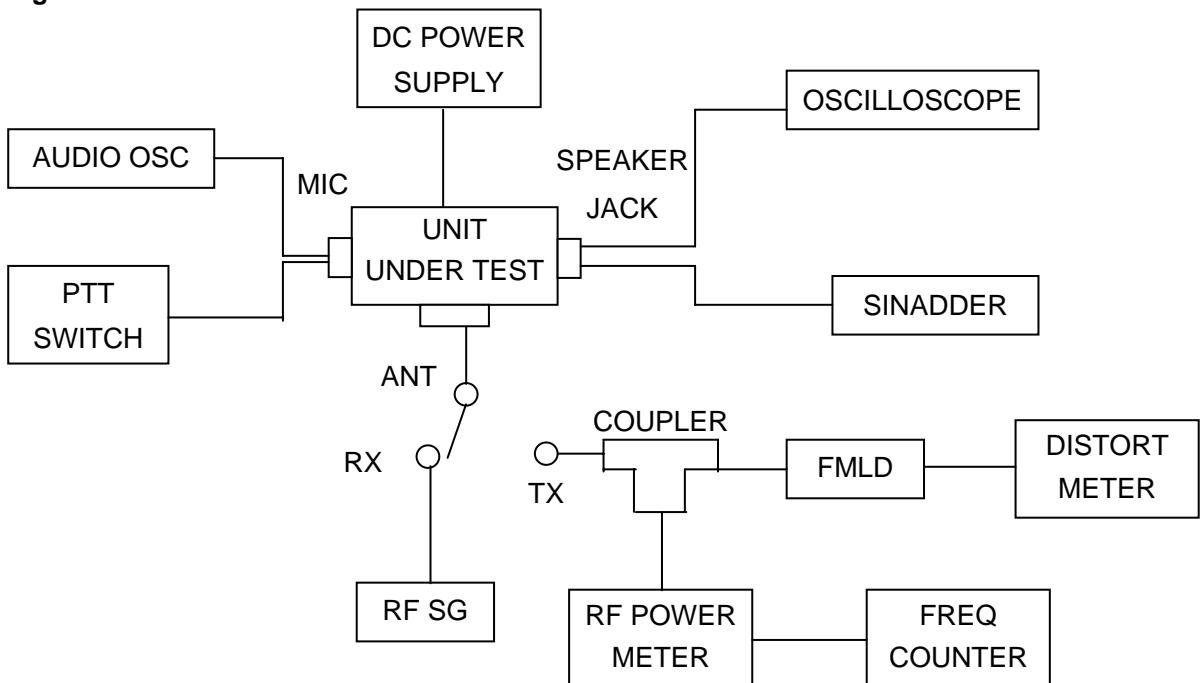

The test equipment listed below are used for the test setup shown in Fig. 3.1.

This test setup used either partially or totally during the following adjustments.

Test Equipment

ADJUSTMENT PROCEDURE

Step	Adjustment	Test Point	Procedure
1	L22 Receive	TP1	1. Connect digital voltmeter to TP1 on RF PCB. 2. Set CH01. 3. Adjust L18. 4. TP1 voltage 1.2~1.6V DC.
2	L23 Transmit	TP1	1. Connect a digital voltmeter to TP1 on RF PCB. 2. Set CH01. 3. Adjust L20. 4. TP1 voltage 1.2~1.6V DC.
3	VC1		1. Connect the antenna coupler output to a frequency counter. 2. Set channel to CH01 (156.050 MHz). 3. Adjust VC1 to obtain a frequency reading 156.050 MHz±200Hz.
4	VR2 Modulation		1. Connect the antenna coupler output to an FM linear detector. 2. Connect Audio Oscillators to Microphone Jack. 3. Set unit to transmit mode. 4. Set audio oscillator output to -23dBm 1 kHz. 5. Adjust VR2 to obtain ±4.5 kHz deviations.
